Risk assessment is a systematic process used to identify, analyze, and evaluate potential risks and uncertainties associated with a particular situation, project, or activity. It is a critical tool for decision-making and risk management in various domains, including business, environmental management, project management, and safety planning.

A general description of risk assessment involves the following key components:

Identification of Risks: The first step in risk assessment involves identifying potential risks and hazards that could impact the objectives, goals, or outcomes of a project or activity. This can encompass a wide range of factors, including external threats, internal weaknesses, and unforeseen events.

Analysis of Risks: Once risks are identified, they are analyzed to assess their likelihood and potential impact. This analysis considers the probability of each risk occurring and the severity of its consequences.

Risk Evaluation: In this phase, the assessed risks are evaluated to determine their significance and prioritize them based on their potential impact on the project or activity. Risks are categorized as high, medium, or low risk, helping decision-makers focus on the most critical issues.

Risk Mitigation and Control: After evaluating risks, strategies are developed to mitigate or control them. These strategies can include risk avoidance, risk reduction, risk transfer, or risk acceptance. Mitigation plans are put in place to minimize the likelihood and impact of high-risk events.

Monitoring and Review: Risk assessment is an ongoing process. Regular monitoring and review of the risk management plan help ensure that it remains effective and up to date. Adjustments are made as new risks emerge or as the project progresses.

Communication and Reporting: Effective communication of risks and risk management strategies to stakeholders is essential. Transparency and clear reporting allow for informed decision-making and a shared understanding of the risks involved.

Documentation: Comprehensive documentation of the entire risk assessment process is crucial. This includes recording identified risks, their analysis, evaluation, mitigation plans, and outcomes.

Risk Assessment No.: 1	Date:	Version No.:1	Review Date:	Authorised by: Dulan Perera
	3/11/2023		4/11/2023	
Step 1: Enter information about the task, activity or	health and safet	y issue, including th	ne location and the people of	completing the risk assessment
Reason for this risk assessment:				
☐ New task ☐ New information	☐ Chang	ge to existing work	environment/task/object/t	ool
Cyclic review				
☑ Identification of a health and safety hazard	☐ Other:	<u> </u>		
Location (including building and room): AD103	Δ	ssessed by: Dulan	Perera	HSR/worker representation:
Description of task/activity/issue (if necessary, obse	rve/analyse the	task being perform	ed by different people at di	fferent times to capture variation in work flow)
This project involves the development of an Environn	nental Sensor Da	ta Logger with SDI-1	.2 interface, using an Arduin	o Due microcontroller. The system integrates multiple
environmental sensors, including the BME680 sensor	for temperature	, humidity, pressure	e, and gas data, as well as th	e BH1750FVI sensor for digital light intensity
measurements. The project aims to monitor and reco	ord environmenta	al data for various ap	oplications, such as weather	monitoring, environmental research, or industrial
automation. The project aims to develop a robust and	d user-friendly er	nvironmental monito	oring system. Implement da	ta logging for long-term data storage and analysis, Create
a graphical user interface for data visualization, Ensu	re system reliabil	ity, safety, and com	pliance with environmental	regulations, Serve as a versatile tool for various
applications, including research, industrial automatio	n, and education	are also part of the	project objectives.	
Workplace conditions (describe environment, layou	t and physical co	nditions – including	g access and egress)	
This project is completed in AD103 under the supervi	sion of Dulan Per	era. The workplace	is adequately equipped wit	n essential amenities. This includes well-structured
workbenches, conveniently placed electrical outlets,	sufficient and ap	propriate lighting, a	nd effective ventilation. The	se provisions are fundamental to facilitate electronics
assembly, sensor testing, and coding activities. The w	orkspace has bee	en furnished with cr	itical safety equipment such	as fire extinguishers, first-aid kits, and eye protection
gear. In addition to providing these safety essentials,	clear and compre	ehensible safety pro	tocols is established and co	mmunicated to all project team members. Adequate
training on the safe handling of electrical component	s and chemicals i	s indispensable. An	orderly inventory of electro	nic components, sensors, and tools has been maintained
which is vital.				
Hazards to consider				

Prepared by:

Health, Safety & Wellbeing

Issued: Nov 2019

Review: Nov 2022

Printed copies are considered

Electrical Hazards	Risk of electric shock or short circuits while working with electronic components.	Fire Hazard	Overheating or electrical faults in components can pose a fire hazard.	Physical Injury	Risk of physical injury, such as cuts or burns, when handling tools or equipment.
Chemical Exposure (Gas Sensor)	The BME680 sensor includes a gas sensor that may involve exposure to certain gases.  Risk of inhaling or coming into contact with potentially harmful gases.	Inadequate Calibration and Testing	If the sensors are not correctly calibrated, the data collected may be inaccurate, which could lead to incorrect conclusions or actions.	Human Error	Mistakes made during assembly, wiring, or coding can result in equipment malfunction or data inaccuracies.
Data Privacy and Security	Risk of unauthorized access to sensor data, which may contain sensitive information.	Power Supply Issues	Disruptions in the power supply may lead to data loss and system downtime.	Budget and Resource Constraints	Overruns of the project budget may lead to resource constraints and potential project delays.
Environmental Impact	Improper disposal of electronic components and waste materials can harm the environment. Risk of releasing hazardous materials or contributing to electronic waste.	Exposure to Dust and Particles	When working with electronic components or conducting maintenance, there is a risk of exposure to dust and small particles that may irritate the respiratory system.	Handling of Sensors	The sensors themselves may have specific handling requirements that, if not followed, could lead to inaccurate readings or damage.

#### Step 2: Risk rating – risk matrix and definitions

		Consequence							
		Minor 1	Disruptive 2	Significant 3	Critical 4	Catastrophic 5			
	Almost Certain	Moderate	Major	High	Very High	Very High			
	5	5	10	15	20	25			
0	Likely	Moderate	Moderate	Major	High	Very High			
8	4	4	8	12	16	20			
Likeliho	Possible	Low	Moderate	Major	Major	High			
<u>s</u>	3	3	6	9	12	15			
=	Unlikely	Low	Moderate	Moderate	Moderate	Major			
	2	2	4	6	8	10			
	Rare	Low	Low	Low	Moderate	Moderate

	-
	Likelihood
Almost	99% probability
certain:	Could occur within 'days to months'
Likely:	>50% probability Could occur within 'months to years'
Possible:	>10% probability May occur shortly but distinct probability it will not Could occur within 'the next three to five years'
Unlikely:	>1% probability May occur but not anticipated Could occur in 'five to ten years'
Rare:	<1% probability Occurrence requires exceptional circumstances Exceptionally unlikely even in the long term future Only occurs as a '100 year event'

	Consequence
Catastrophic:	Multiple fatalities  Multiple significant irreversible disabilities  Systemic instances of mental health issues
Critical:	Single fatality Severe irreversible disabilities Widespread workforce stress or clusters of mental health issues affecting delivery of services and initiatives
Significant:	Long term injuries / disability Short term hospitalisation and rehabilitation Workforce stress or elevated levels of mental health issues affecting delivery of initiatives
Disruptive:	Injury requiring medical treatment Sustained lost time Mental health issues impacting delivery
Minor:	Injury requiring minimal medical treatment or first aid

	Risk rating priority	
Risk rating	Action	Recommended action time frame
High/Very high	Cease activity or isolate source of risk Implement further risk controls Monitor, review and document controls	Immediate Up to 1 month Ongoing
Major	Implement risk controls if reasonably practicable Monitor, review and document controls	Within 1 to 3 months Ongoing
Moderate	Implement risk controls if reasonably practicable Monitor, review and document controls	Within 3 to 6 months Ongoing
Low	Monitor and review	Ongoing

Step 3: Identify hazards and associated risk scores and controls									
For a task or activity, list each	Who can get harmed and how?	Uncontrolled	Controls required	Residual risk	Implementation of controls				
step		risk score		score	Person/s	Due Date	Indicate		
or					responsible		when
